

ARIAN NOURANI

Junior DevOps & Site Reliability Engineer (SRE)

Kermanshah, Iran | arian.nourani.2005@gmail.com

GitHub: [arian-0058](https://github.com/arian-0058) | Portfolio: arian-0058.github.io

PROFESSIONAL SUMMARY

Detail-driven and performance-focused Junior DevOps and SRE Engineer with solid hands-on experience in building automated CI/CD workflows, orchestrating multi-container environments, and executing root cause analysis (RCA) across Linux and cloud environments. Proven ability to decrease simulated Mean Time to Resolution (MTTR) to under 10 minutes through automated failure injection playbooks. Skilled in container security, infrastructure hardening, and Python-driven automation, with a continuous focus on zero-downtime operations and shift-left security.

TECHNICAL SKILLS

- **Operating Systems & Security:** Linux (Ubuntu/Debian), Server Hardening, SSH Key Auth, UFW, Iptables, Least Privilege Access Model, File Permissions.
- **Containers & Orchestration:** Docker, Multi-Stage Builds, Docker Compose, Volume Persistence, Container Networking, Health Checks.
- **CI/CD & DevSecOps:** GitHub Actions, Shift-Left Security, Trivy (CVE Scanner), Hadolint, Automated Testing (Pytest), Flake8, Docker Hub Registry.
- **Networking & Web Servers:** Nginx (Reverse Proxy & Caching), TCP/IP, DNS Troubleshooting, Subnetting (VLSM), Socket Monitoring (ss, lsof, fuser).
- **Scripting & Development:** Python (Flask, Automation Scripting), Bash Shell Scripting, REST APIs, AI/LLM API Integration.
- **Databases & Cache:** PostgreSQL, MariaDB/MySQL, Redis (In-Memory Data Store).
- **Reliability & Troubleshooting:** Root Cause Analysis (RCA), Incident Runbooks, Failure Injection, Log Analysis, Idempotent Recovery Scripts.

KEY TECHNICAL & SYSTEMS ENGINEERING IMPLEMENTATIONS

DevOps Incident & Systems Reliability Engineering

Focus: Infrastructure Troubleshooting, Root Cause Analysis (RCA) & Automated Recovery

- **Engineered** a specialized Incident Simulation Lab covering 10+ real-world production failure scenarios across Linux OS internals, network sockets, container lifecycles, and automation workflows.
- **Reduced** simulated Mean Time to Resolution (MTTR) to under 10 minutes by developing structured 6-stage Root Cause Analysis (RCA) playbooks and automated diagnostics for critical issues such as File Descriptor leaks, Inode exhaustion, and port collisions.
- **Architected** automated failure injection and idempotent recovery scripts in Bash, guaranteeing 100% environment isolation and reproducible postmortems without destructive downtime.
- **Troubleshooted** complex Systemd service failures, zombie processes, and host-to-container volume permission discrepancies, documenting prevention architectures and lessons learned.

Automated CI/CD & DevSecOps Delivery Pipeline

Focus: Continuous Integration, Shift-Left Vulnerability Scanning & Mock Deployments

- **Architected** an end-to-end automated GitHub Actions CI/CD pipeline for a 3-tier microservice stack (Nginx Proxy + Flask Backend + Redis Cache), cutting build and feedback cycles to under 3 minutes.
- **Integrated** Shift-Left security validation by automating Dockerfile linting via Hadolint and vulnerability scanning via Trivy, enforcing zero critical/high CVE releases into the registry.
- **Optimized** container footprints and deployment speed by authoring multi-stage Dockerfiles with layer caching and enforcing non-root user execution (appuser) for enhanced runtime security.
- **Implemented** automated staging mock deployments on ephemeral runners, leveraging dynamic Git SHA tagging and automated curl smoke tests to validate HTTP routing and endpoint health before release.

Production Infrastructure & Security Hardening

Focus: Linux Hardening, Network Architecture & Container Stacks

- **Containerized** a multi-service web architecture using Docker Compose, establishing custom isolated bridge networks and persistent storage volumes to ensure high availability and data durability.

- **Hardened** Linux server nodes by disabling password logins and root access over SSH, restricting attack surfaces via UFW firewall rules, and automating baseline security configurations.
- **Automated** scheduled database disaster recovery workflows for MariaDB and PostgreSQL using Bash cron scripts, guaranteeing a Recovery Point Objective (RPO) of under 24 hours.
- **Designed** enterprise-grade IP allocation plans using Variable Length Subnet Masking (VLSM) algorithms, maximizing address utilization and mitigating broadcast collision domains.

FEATURED OPEN-SOURCE REPOSITORIES

DevOps Incident & Troubleshooting Lab | Repo: [arian-0058/devops-troubleshooting-scenario](#)

Tech Stack: Linux Kernel Diagnostics, Bash, Docker, Nginx, Systemd, TCP/IP, SRE Playbooks

- Built an open-source, hands-on production crisis lab featuring automated failure injection scripts, real-time symptoms tracking, and step-by-step remediation procedures.
- Authored in-depth technical postmortems detailing kernel-level resource exhaustion (unlinked open files, ulimit caps) and network lockout scenarios.

Automated CI/CD DevSecOps Pipeline | Repo: [arian-0058/automated-ci-cd-pipeline](#)

Tech Stack: GitHub Actions, Docker Buildx, Python (Flask), Redis, Nginx, Trivy, Hadolint, Pytest

- Built a complete automated delivery framework with dual-tagging mechanisms (latest & Commit SHA) published to Docker Hub.
- Documented troubleshooting case studies resolving CI runner environment isolation errors and Docker build context issues.

Industrial SRE Portfolio & Incident Tracker | Site: [arian-0058.github.io](#) | Repo:

[arian-0058/arian-0058.github.io](#)

Tech Stack: HTML5, CSS3, JavaScript, GitHub Pages, JSON Data Synchronization, GitHub Actions

- Designed and deployed a responsive technical showcase featuring a real-time incident matrix synced automatically from live GitHub troubleshooting repositories.

EDUCATION

Bachelor of Science in Computer Engineering

National Skills University (Technical & Vocational University)

Currently in Semester 5 (Expected Graduation: 2028)
